IMRAN SHAUKAT

Dear Hiring Manager,

I have been working with computer Hardware since High School, and I started learning python in college. When I started college my college did not have a BioTech major, and I was really interested in the incorporation of technology with Human biology. My major in college was Biochemistry. In college I spent a lot of time learning python, and I found python really interesting.

- Over the last year I have created multiple projects using REACT, REDUX, EXPRESS, FLASK, SQL, SQLAlchemy, POSTMAN, RENDER, HTML, and CSS. Also, used Google Map APIs, Weather API, react-icon library, and much more.

- I have spent lot of time working with REACT, creating an intuitive, interactive Frontend for my projects with help of CSS. The backbone of my projects was designed with either EXPRESS or FLASK (backend), which provided smooth functionality and connected frontend to the PostgreSQL (Database).

- My Capstone Project named Activities uses REACT for Frontend and Flask for the Backend. The idea behind the project is to see the activities available to the user in their free time. It is essentially an ecommerce website, where users can purchase their tickets to engage in different activities. This project uses Google Maps API for location and Weather APIs for weather information.

I have spent a lot time working in many different group projects. I do not hesitate to introduce myself to a new group and help nurture a productive and respectful working environment. I have experience with mentoring fellow EMTs with new procedure or protocols.
Thank You for your time and please look at my projects
